### Applications

Portfolio Choice General Equilibrium Consumption & Savings

Conclusion

## Overview: Three Main Elements

## **1** Felicity at *t*: $\hat{E}_t [U(c_1, ..., c_T)]$

- Agents care about utility flow today and
- expected utility flows in the future
- $\Rightarrow\,$  happier if more optimistic

### 2 No split personality

- Distorted beliefs distort actions
- $\Rightarrow$  better outcomes if more rational

### Optimal beliefs balance these forces

• Beliefs maximize well-being  $\frac{1}{T}E\left[\sum_{t=1}^{T}\hat{E}_{t}\left[U\left(c_{1},...,c_{T}\right)\right]\right]$

Conclusion

## The General Framework

Actions: <u>At each t</u> agent chooses  $c_t$  to maximize felicity<sub>t</sub> given subjective beliefs  $\hat{\pi}(s_t|s_{t-1})$ , and resource constraints.

**Felicity** <u>at</u> t:  $\hat{E}_t[U(c_1,...,c_T)]$ 

with time-separable exponential discounting equals

$$\underbrace{\sum_{\tau=1}^{t-1} \beta^{\tau} u(c_{\tau})}_{\text{memory' utility}} + \beta^{t} u(c_{t}) + \underbrace{\hat{E}_{t} \left[ \sum_{\tau=t+1}^{T} \beta^{\tau} u(c_{\tau}) \right]}_{\text{'expected' utility}}$$

Note:  $\beta$ s for past consumption could be replaced with  $\delta$ .

Portfolio Choice General Equilibrium Consumption &

Conclusion

# Proposition Hetereogeneous Priors

For S > 2 agents split into two groups with different beliefs (i) Optimists with  $\hat{E}^{i} [Z^{OE}] > 0$  and  $\alpha^{OE,i} > 0 = \alpha^{RE}$ (ii) Pessimists with  $\hat{E}^{j} [Z^{OE}] < 0$  and  $\alpha^{OE,j} < 0$ 

both groups trade against each other and  $\{\hat{\pi}^i\} \neq \{\pi\} \neq \{\hat{\pi}^j\}$ .

- Example
  - $u(c) = \frac{1}{1-\gamma}c^{1-\gamma}$  with  $\gamma = 3$ ,
  - $\pi_1 = 0.25, \ \pi_2 = 0.75,$
  - $\varepsilon_1 = -0.6$ ,  $\varepsilon_2 = 0.2$  so  $P^{RE} = 1$ .

### Brunnermeier & Parker

Framework

Discussion

Literature

Applications

Portfolio Choice

General Equilibrium

Consumption & Savings

Conclusion

In this example, as we vary the economic environment, beliefs change . . .

 $P^{O\overline{E}} > P^{RE} = 1$  if payoff is positively skewed (long-shots, IPO)  $P^{OE} < P^{RE} = 1$  if payoff is negatively skewed (stock market).

### Conjecture

For multi-asset case with positive net supply:

- Heterogeneity in beliefs is less pronounced.
- Agents invest in different skewed assets (forgo diversification benefits to hold skewed assets.)

### Complicates Aggregation:

Representative agent has different preference structure from individual (possibly identical) investors.

### Applications

Portfolio Choice General

Equilibrium Consumption &

Conclusion

In this example, as we vary the economic environment, beliefs change . . .

 $P^{O\overline{E}} > P^{RE} = 1$  if payoff is positively skewed (long-shots, IPO)  $P^{OE} < P^{RE} = 1$  if payoff is negatively skewed (stock market).

### Conjecture

For multi-asset case with positive net supply:

- ♦ Heterogeneity in beliefs is less pronounced.
- Agents invest in different skewed assets (forgo diversification benefits to hold skewed assets.)

### Complicates Aggregation:

Representative agent has different preference structure from individual (possibly identical) investors.

Conclusion

# Consumption & Savings

- Empirical Phenomena:
  - households expect upward sloping consumption profile (Barsky et al. (1997))
  - actual average consumption growth is non-positive and profiles are concave (Gourinchas & Parker (2002))
- Setup:
  - Finite-lived agent, quadratic utility  $u(c_t) = ac_t \frac{1}{2}bc_t^2$ ,
  - one risk-free asset,  $R\beta = 1$ ,
  - i.i.d. income:

# Conclusion

### Optimal Expectations

### Brunnermeier & Parker

Framework

Discussion

Literature

### Applications

Portfolio Choice General Equilibrium Consumption & Savings

Conclusion

- Rational expectations are sub-optimal:
  - Agents with rational beliefs makes the ex post best decisions
  - but agents that care about the future can be happier with some optimism
  - Utility gain determines biases
- Optimal expectations is a structural model of non-rational beliefs
  - beliefs are most distorted when decision errors are small
  - beliefs are most distorted when "dream" benefits are largest
  - excess risk taking due to optimism, preference for skewness
  - endogenous heterogenous beliefs; agreeing to disagree
  - overconfidence, optimism, and lack of consumption insurance
  - subjective procrastination, planning fallacy, context effect
